What is the inner Solar System?

The inner Solar System is the region comprising the terrestrial planets and the asteroids. Composed mainly of silicates and metals, the objects of the inner Solar System are relatively close to the Sun; the radius of this entire region is less than the distance between the orbits of Jupiter and Saturn.

How does eyes of the Solar System work?

Eyes of the Solar System uses data and images from NASA missions to give you a simulated view of our solar system. NEO Surveyor will hunt asteroids and comets that are potential hazards to Earth. Launch is no earlier than September 2027. Europa Clipper launched Oct. 14, 2024, to conduct a detailed investigation of Jupiter's moon Europa.

How do I use this interactive 2D simulation of our Solar System?

Welcome to this interactive 2D simulation of our solar system. This educational tool allows you to explore the planets, their orbits, and their relative speeds. You can pan, zoom, and focus on different celestial bodies to get a better understanding of our cosmic neighborhood. Pan: Click and drag (or touch and drag) on the canvas to move the view.

Where is the Solar System located?

The Solar System is located in the Milky Way, a barred spiral galaxy with a diameter of about 100,000 light-years containing more than 100 billion stars.

Apia Prime, the main planet within the solar system, has three major continents with the central simply being Apia. Apia, the continent, was home to a major event, Latrell's Rebellion.

Explore the 3D world of the Solar System. Learn about past and future missions.

The Solar System currently moves through a cloud of interstellar medium called the Local Cloud. The closest star to the Solar System, Proxima ...

The newly discovered Manhattan-sized interstellar object zooming through our solar system has been identified as a comet -- but ...
