What is the Danish Green research & innovation strategy?

The strategy sets a clear direction for the Danish green research and innovation effort in order to accelerate the development of technologies and solutions, which can help protect our climate, nature and environment.

What is the Danish green transition?

The Danish green transition involves significant electrification across sectors. Denmark's electricity consumption is expected to double by 2030 and increase fivefold by 2050. This will be met by massive growth in both onshore and offshore renewable energy sources (RES).

How many technologies will GreenCom develop?

GreenCOM will develop 31 specific technologies supporting 5 strategies, ranging from physical chips and laser sources, over network protocols, to internet services initiating a first coordinated effort towards a green ICT certificate.

Is Denmark going green?

With enough clean energy to electrify over 13 million homes, Denmark isn't just going green. It's going global. Imagine two massive hubs out at sea--futuristic power stations floating like green beacons in the waves. This isn't science fiction. It's Denmark's bold plan to reshape the energy landscape of Europe.

Denmark's success comes from a combination of strong government policies, investment in renewable energy, and public support for sustainability. The country leads in wind energy, ...

This initiative, backed by a 20-year contract with the Danish Energy Agency, was designed to capture point-source emissions from the Asnæs and Avedøre power stations.

Energinet has been investigating whether the project should be established on a foundation made up of several large platforms instead of an artificial island. The Danish ...

GreenCOM will develop 30 specific technologies supporting the overall network, ranging from physical chips and laser sources, over network protocols, to internet services and a green ICT ...
