What is a flywheel-storage power system?

A flywheel-storage power system uses a flywheel for grid energy storage,(see Flywheel energy storage) and can be a comparatively small storage facility with a peak power of up to 20 MW. It typically is used to stabilize to some degree power grids,to help them stay on the grid frequency,and to serve as a short-term compensation storage.

What is a flywheel energy storage module?

A flywheel energy storage module is a stand-alone unit,requiring just 480V AC power and communication connections to operate. Each module consists of a flywheel,power control module,flywheel foundation,cooling system,and the necessary mounting and support facilities. Modules are designed to function on a fully independent basis.

What is a beacon flywheel energy storage system?

They can be installed at the transmission or distribution levels or even in remote connected or isolated grids. The modular and distributed architecture of Beacon flywheel energy storage systems allows flexibility in power capacity as well as siting. A single flywheel module easily connects to others, allowing for incremental storage expansion.

What is a flywheel storage power plant?

In Ontario,Canada,Temporal Power Ltd. has operated a flywheel storage power plant since 2014. It consists of 10 flywheels made of steel. Each flywheel weighs four tons and is 2.5 meters high. The maximum rotational speed is 11,500 rpm. The maximum power is 2 MW. The system is used for frequency regulation.

Our successful operation of these plants is driven by our patented flywheel technology and advanced grid integration and power control systems.

Fig. 1 shows the comparison of different mechanical energy storage systems, and it is seen that the Flywheel has comparatively better storage properties than the compressed air ...

Beacon's 20-MW system has been designed to provide frequency regulation services by absorbing electricity from the grid when there is too much, and storing it as kinetic energy in a ...
