VFDs, also known as frequency inverters, generate high-frequency switching signals during the power conversion process, which can lead to conducted and radiated EMI.

Abstract--We investigate the conducted electromagnetic interference (EMI) emissions for a variable-frequency, soft-switching, half-bridge dc-ac inverter.

High-frequency signals should have a low-impedance return path from the ground plane. One useful tactic for avoiding ground loops is star grounding, in which multiple ground points ...
