---

VIL is the input low voltage which corresponds to an output high voltage with a slope of -1. the most common type of inverter in VLSI is CMOS. This is due to the low static power ...

In order to avoid a voltage distortion surpassing 5 %, it is mandatory to set the current threshold limit at 1.5 times the crest value of the nominal effective current of the inverter.

Appliances that need DC but have to take power from AC outlets need an extra piece of equipment called a rectifier, typically built from electronic components called diodes, ...

If non linear loads are connected within the rating of the inverter, the inverter's output voltage remains sinusoidal and the inverter supplies non sinusoidal current as demanded by the load.
