Are string inverters better than microinverters?

Microinverters and optimized string inverters are typically more expensive than string inverters but are better for more complex roofs. Solar companies have used string inverter technology for decades. It's an incredibly reliable, tried-and-true technology and is the most affordable option available today.

Are microinverters bad?

Another thing to note about microinverters is that they may cause you to experience "clipping", when the solar panel produces more power than an inverter is capable of handling. While this does technically cause energy loss, solar systems are designed with these specifications in mind. What are string inverters?

Should I use a microinverter or string inverter for my solar system?

A common decision you'll have to make when designing your custom solar system is whether to use microinverters or string inverters. The basic function of an inverter is to change the Direct Current (DC) power generated by your solar panels to Alternating Current (AC) that can be used to power your home.

What is a microinverter & how does it work?

Microinverter is another type of PV inverter which is typically installed on individual solar panels. Similarly, microinverter converts DC power from solar panels to AC power for electrical loads. The difference is that a microinverter is a type of Module-Level Power Electronics (MLPE) that optimises individual solar panels' efficiency.
