Why is cls sometimes used instead of self as an argument in Python classes? For example: `class Person: def __init__(self, firstname, lastname): self.rstname = firstname self.`

Are you supposed to use self when referencing a member function in Python (within the same module)? More generally, I was wondering when it is required to use self, not ...

See [Why do I get "takes exactly 1 argument \(2 given\)" when trying to call a method?](#) for the opposite problem.

Everyone is aware of this in javascript, but there are also instances of self encountered in the wild, such as here [So, what is the difference between this and self in ...](#)
