What is a battery energy storage system?

A battery energy storage system (BESS), battery storage power station, battery energy grid storage (BEGS) or battery grid storage is a type of energy storage technology that uses a group of batteries in the grid to store electrical energy.

Why should you partner with a battery energy storage system?

Partner with us to address your power needs and construct a resilient infrastructure. Battery energy storage systems (BESS) maintain a reliable power supply by enabling peak shaving, lowering carbon emissions, and supporting the integration of alternative energy sources into microgrids.

What is battery storage & how does it work?

Battery storage can be used for short-term peak power demand and for ancillary services, such as providing operating reserve and frequency control to minimize the chance of power outages. They are often installed at, or close to, other active or disused power stations and may share the same grid connection to reduce costs.

How does a battery energy storage system improve microgrid resilience?

Modern BESSs boost microgrid resilience by providing reliable backup power and stabilizing energy supply. They efficiently manage demand, reduce reliance on traditional power, and integrate seamlessly with renewable sources. (See Figure 3) Figure 4. Battery energy storage system components
